How do you allow your access to your Wi-Fi, Front Door or Tool Shed?

What are your options?

**Perimeter Defense**
Build a fence around your house and lock it up
- You may not separate credentials for cloud apps
- Inconvenient for users

**Single Sign On (SSO)**
One master key gives access to all items
- You have no idea who has accessed which resource and when
- An identical key for all resources poses a security risk
- You still need separate credentials for cloud apps
- No control for IT
- Inconvenient for users
- There is only one access point—the VPN

**Cloud Access Management**
- Flexible and granular access controls
- Full visibility of all access events
- Great user experience and more secure

What if your master key is lost or stolen?
- You can no idea who has accessed which resource and where
- No cloud access for IT
- Inconvenient for users

There is only one access point—the VPN

- You can separate credentials for cloud apps
- Inconvenient for users

But what if your master key is lost or stolen?

- You cannot separate credentials for cloud apps
- Inconvenient for users
